Introduction

A success which is generally seen as an internal ability within an individual is indeed also prejudiced by many external factors including the behavior of parents during childhood. Although the father is a significant role model, the role of mother in a child’s growth is indubitable. In this reverence the influence of the profession of a mother, particularly, whether the mother is working or not becomes a central factor for scrutiny. The foremost distress is that maternal employment clearly confines the amount of instance dedicated to raising children. The involvement of the mothers is influential, the individuality of their children cannot be neglected, but an unparalleled figure of women, especially mothers, are inflating in the field of employment due to monetary obligation or in explore of individuality. This had piloted to a drastic shift in the conventional role of mother as a “care taker” to a “bread earner” and has Self-confidence is the thought that one will bring out in an accurate, perfect or well-organized way. Self-confidence is having self-sufficiency in oneself. Self-confidence can distantly be illustrated as the ability of a person to struggle. Developing self-confidence can provide you the inspiration to accept challenges and weaknesses, so as to acquire trust and understanding in an individual. Self-confidence is an approach which permits individuals to have positive yet critical views of themselves and their circumstances. Self-confident individual’s belief their own abilities have a common way of control in their life’s. Self confidence is vital to good psychological alteration, individual pleasure and efficient performance in children and adults. The name self confidence is used to demote to individual’s judgement about them. Children with overall high ideas are certain about their attitude to achieve their objectives, scholastic competency and association with guardians and other people. Children with low self confidence, lean to be anxious about strange ideas and avoid attracting deliberation. Self confidence refers to an individual’s perceived aptitude to operate efficiently in a condition to overcome obstructions and to get things to go alright. Navedita and Rani (2017) revealed that there was no significant difference between married and unmarried university students on women social freedom and self confidence. It was also indicated that married and unmarried university students have no significant difference for women social freedom having high and low self confidence. Saini (2016) revealed that no significant difference was found in self confidence of high
school students in relation to gender, social category and family type. Macaroni (2016) indicated that students pursuing graduation was more confident than the higher secondary school students. It was also indicated that male graduate students have high self confidence in comparison to higher secondary school male students. Further, it was found that female graduate students were more confident than the female higher secondary school students. Verma & Kumari (2016) found that there exists a significant relationship between self confidence and academic achievement. The results also depicted that no significant difference was found between boys and girls of elementary school students on self confidence. It was also found that there exists a significant difference in the academic achievement of elementary school students having high and low self-confidence. Nadhi & Kotnala (2014) found that rural adolescents, both, male or female, have less parental encouragement which in turn, leads to lesser self confidence. It was also found that urban adolescents both male and female have high parental encouragement which leads to a higher level of self confidence. The study also revealed that there was substantial difference amongst academic achievement of 11th class students having high and low self-confidence.

Basavana (1975) Self-confidence refers to an individual’s perceived aptitude to operate efficiently in a situation to overcome obstructions and to get things to go alright.

Need and Importance

Self confidence is an approach that you hold about yourself that let you to go forward and reach your aims. The most imperative thing to defend is confidence and faith in the person. It is the groundwork of all personal accomplishments. You can achieve higher goals in life when you believe in yourself. Self confidence is frequently a most essential asset than ability, knowledge or even experience. Self confidence can alter your whole life to the better, but not having self confidence will absolutely have a negative effect on your every part of life. Self confidence is an important factor for better academic excellence. Building self confidence in students is one of the most significant both for parents as well as educationists to set good environment for learning, which is a key constituent to high achievement. Building confidence in children can help in preventing student dropouts, ensure children maintain their love for learning and help them to achieve their dreams and goals.
After making the survey of the related literature, it is obvious that many studies have been conducted in various areas, but no such study has been conducted on the “Self Confidence of children of working and non-working mothers of Kashmir.” In this background the researcher is interested to work on present study. The problem under study is a humble attempt to assess the Self Confidence of children of working and non-working mothers. The research is very useful and helpful for educationists, policy makers, planners, teachers, administrators, and especially to the parents.

Objectives
The following objectives were formulated for the present investigation:

a) To study and compare children of working and non-working mothers on self confidence.

b) To study and compare children of working and non-working mothers on academic achievement.

Hypotheses
The following hypotheses were formulated for the present investigation:

a) There is a significant difference between children of working and non-working mothers on self confidence.

b) There is a significant difference between children of working and non-working mothers on academic achievement.

Methodology
The present study explored by using descriptive methods.

Plan And Procedure:
Design of the Sample
The sample for the present study consists of 100 children, (children of working mothers 50 and children of non-working mothers, 50 of Kashmir) drawn from various high and higher secondary school students of district Srinagar, Anantnag, Budgam and Pulwama.
Tools

The following tools were used for the present study-

a) Self Confidence inventory by Rekha Gupta Agnihotri.

b) Academic achievement in the present study means the aggregate marks obtained by the sample subjects in all the subjects in their 8th class.

Statistical Analysis

After collecting the data, it was statistically analyzed by computing mean, S.D., t-test and Correlation.

The perusal of the above table displays the comparison between children of working and non-working mothers on self-confidence. The obtained t. The value is (4.61) which show that there is a significant difference between children of working and non-working mothers on self-confidence which is significant at 0.01 level. It indicates that children of working mothers have high self-confidence than the children of non-working mothers. Children of working mothers are open minded, self-reliant.
and are able to accept challenges easily. The above results clear that the hypothesis number one which reads as, there is a significant difference between children of working and non-working mothers on self-confidence stands accepted.

Major Findings

The major findings of the present study are as under:

a) The results depicted that there is a significant difference between children of working and non-working mothers on self-confidence. It was also found that children of working mothers have high self-confidence than the children of non working mothers. Children of working mothers show more confidence and are able to accept challenges and weaknesses readily.

b) The results indicated that there is no significant difference between children of working and non working mothers on academic achievement. Both the groups get equal opportunity to achieve educational goals.

c) The correlation was found between self-confidence and academic achievement of children of working and non working mothers. It was found that there is a positive correlation between self-confidence and academic achievement. This suggests that higher the self-confidence, higher will be academic achievement.
